

# FAMINE & FOOD CRISIS FORECASTING CENTER

## HACKATHON I:YEMEN

Team Presentations, Day 3

# Golden girls

Amy, Hayfa, Lilieth, Maya, Sultan, Yota

## I. Situation analysis and context

### Timeline Food Insecurity - Famine (year 2015-present)

2022-  
present

#### Current Situation

- Child malnutrition is one of highest in world
- Humanitarian situation worsened due to Ukraine-Russia conflict
- July - August 22 - Widespread flooding across Yemen
- Intensified Fighting in Marib & Hajjah

2020-2021

#### Ongoing famine situation

- Death tolls increase as a result of acute food insecurity, lack of healthcare, locust swarms.
- Two-thirds of the population dependent on humanitarian aid
- Drastic increase in cost of food / collapse of Yemen's currency

2018-2019

#### Heading into world's worst famine in 100 years

- Worsening of the conflict
- Scale up of aid operations in the country (by March 2018, 22 ml citizens require humanitarian aid)

2015- 2017

#### Pre-cursors to Yemen catastrophe

- Cholera outbreak
- Food and Supply Blockade - ports closed

Pre-2015

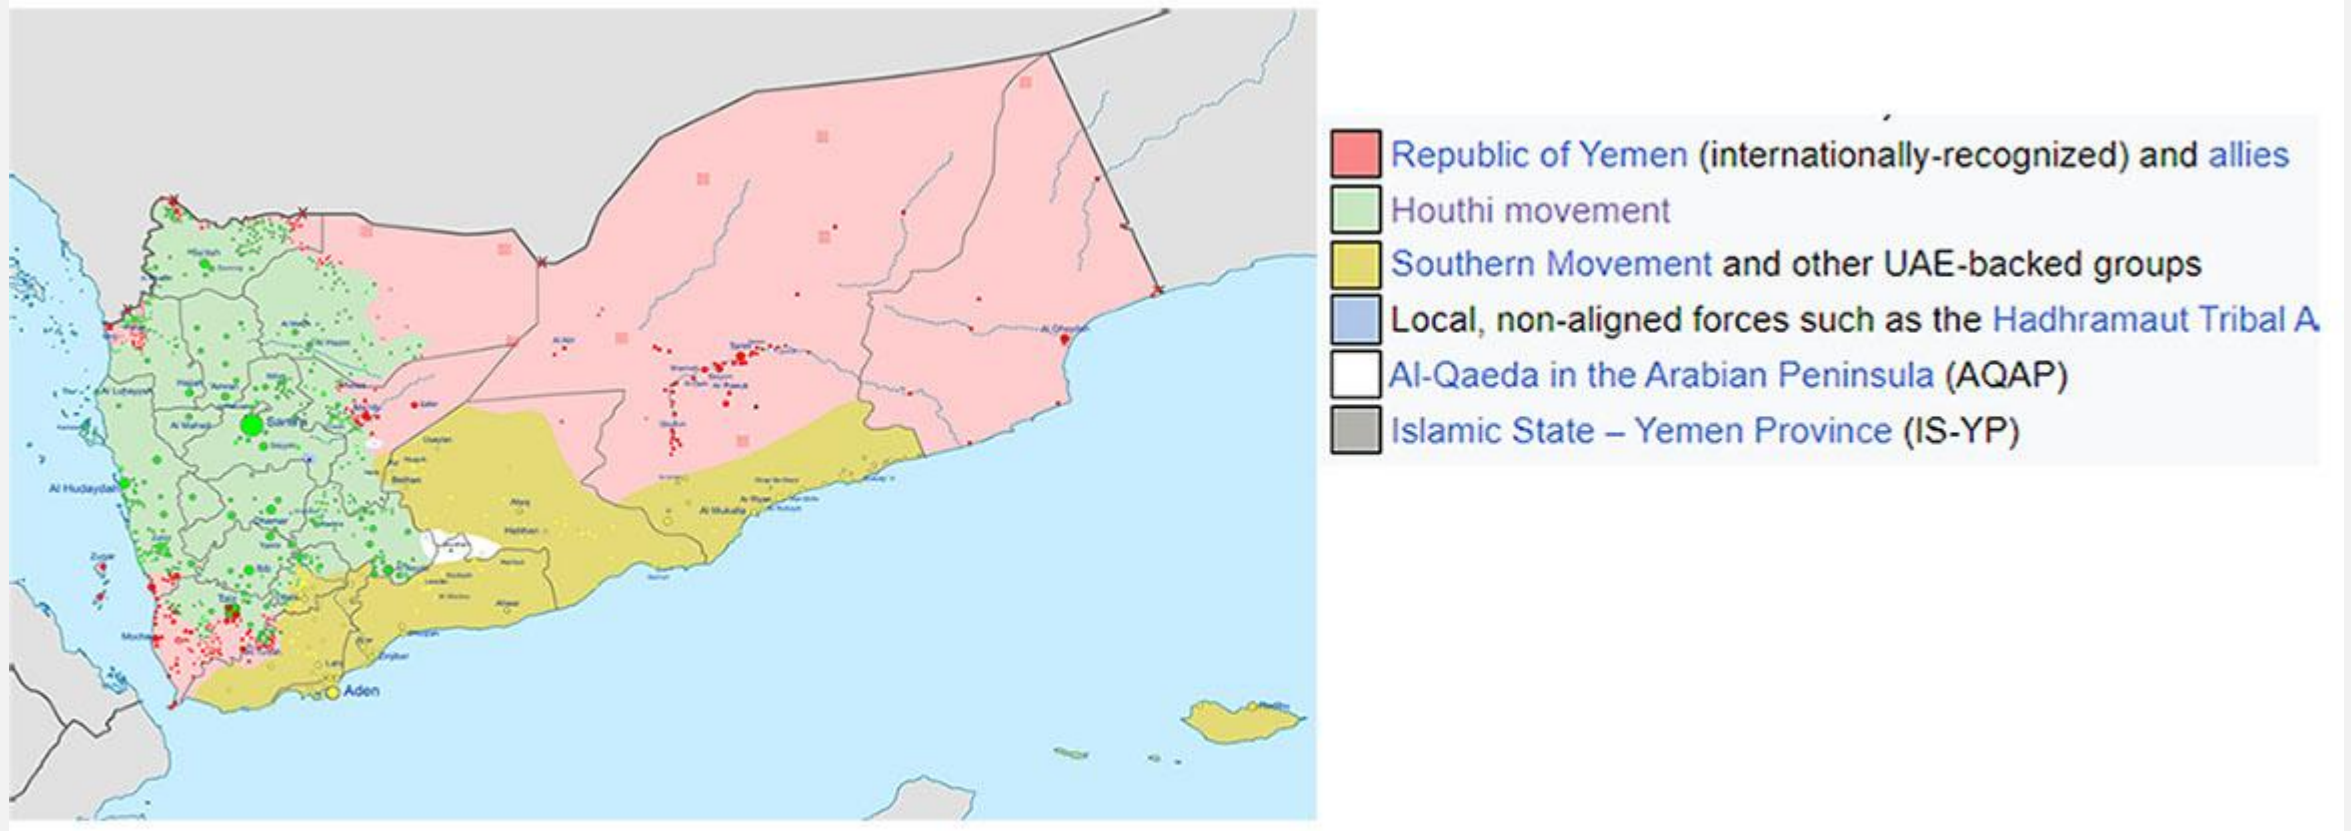

#### Historical context

- Long term political instability / Conflict (civil war since the 90's)
- Cultivation of khat (30% of economy in 2000)
- 90% of food is imported

# Golden girls

## I. Situation analysis and context

Acute Food Insecurity Phase (Dec.2022 - Jan. 2023)

# Golden girls

## I. Situation analysis and context

Acute Food Insecurity Phase (Dec.2022 - Jan. 2023)\_detail (Hajjah & Marib districts)

### IPC v3.1 Acute Food Insecurity Phase

1: Minimal 2: Stressed 3: Crisis 4: Emergency 5: Famine

! Would likely be at least one phase worse without current or programmed humanitarian assistance

Map Source: FEWS.NET (<https://fews.net/east-africa/yemen>)

## Research question

What are the factors that led to worsened food security situation in two governorates (Hajjah and Marib)?

## Outcome (Dependent variable)

Emergency (IPC Phase 4) in Hajjah and Marib (governorates)

## (Independent) Variables that could have led to the outcome

Climatic datasets - Rainfall (compared to averages)

Nutrition indicators - SAM, MAM

Intervention indicators (VITA, MNP, FEFO, etc.)

Population information: IDPs, # flood-affected, density

Food prices

Geographic location - distance from coast (access to seaports)

Conflict zones/intensity

## to better understand..

floods

level of child malnutrition

assistance provided (or not)

number of vulnerable population

Food Security (accessibility)

Food security (availability)

Conflict level

## The final product of this exercise

A dashboard that displays visualization (graphs or/and maps) of the different indicators, change over time, and trends. The purpose of this tool is to assist aid practitioners to assess & monitor / evaluate current interventions and to forecast potential need for future assistance or assistance scale-up.

## Research Question:

- What is the relationship between a rise in pressure factors, changes in food insecurity, delivery of aid, and resulting changes in food insecurity?
- The question was borne to out of curiosity between price spikes and delivery shortfalls.

## Indicators

- Nutritional Support
- Conflict
- Commodity Prices (Terms of Trade)
- Rainfall
- Food Security

Historic buildings and garden in the Old City of Sanaa.

# Database Schema

- **Nutrition:** year, month, governorate, district (p-code), activities, count
- **Conflict:** year, month, governorate, event, fatalities
- **Terms of Trade:** market price, year, month, commodity price, wages and terms of trade
- **Market:** market, governorate, district, distance
- **Rainfall:** year, month, governorate, total precipitation
- **Food Security:** year, month, governorate, metric (rCSI, FCS), score

# Tableau Dashboard

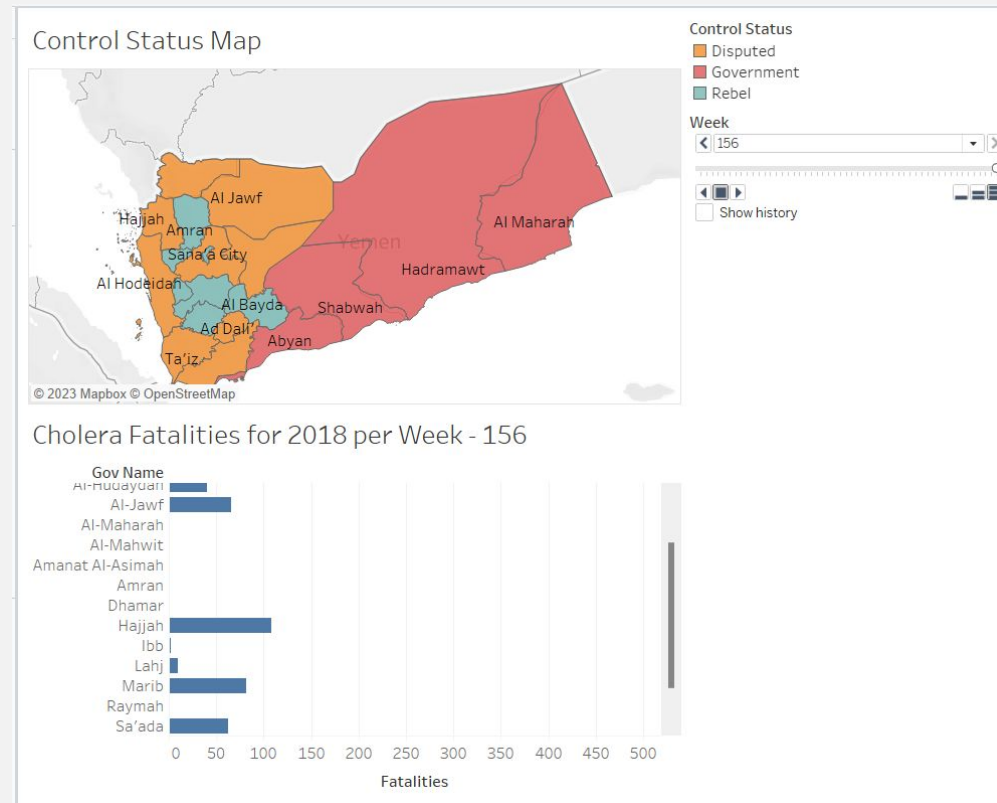

# TEAM Rice

# Our Visualization

How do cholera cases affect the total percent receiving nutrition intervention in rebel, disputed, and coalition-controlled governorates in Yemen in 2018?

## Next Steps

- Expand years included in dashboard
- Improve UI interactivity for better understanding
- Involve other secondary data like rainfall and FCSs
  - Investigate correlations b/w cholera, rainfall, and other factors affecting food insecurity/fatalities
- Fix temporal scale between maps (weeks vs. months)
- Add slider for time with indicators

# Team 3: Framing the Research

Initial research question:

*How “contagious” is a famine?*

Criteria:

- Market prices (terms of trade: ratio of wages of non-qualified labor to market price of wheat flour)
- FCR

In other words: Does change in ToT affect FCS or vice versa over time?  
How long is the **lag**?

# Team 3: FCR and TOT Over Time

X-axis: Time measured in monthly intervals from Sept 2016 to end of Sept 2019

Y-axis: FCS (top) or ToT (bottom) indicators

Notes—

1. Inversions vs. similar movements
2. Averages across the country (not a specific governorate)

# Team 3: 10 month lag

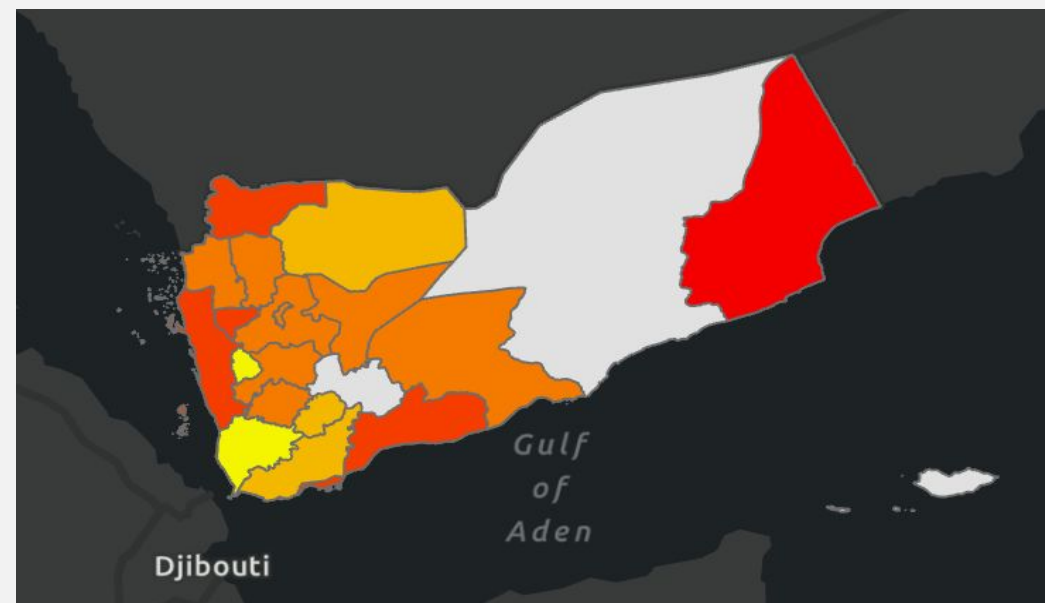

FCS June 2017

ToT June 2017

FCS Dec 2016

# Team 3: Hajjah Governorate Example

Terms of Trade: July 2016 - March 2019

Food Consumption Score: May 2017 - Jan 2020 (10 month lag)

# Team 3: Outstanding Questions

1. Does lag apply outside of the Hajjah governorate?
2. **What is the difference in lag per province & does it correlate with other factors?**
3. Does lag apply across the whole 3 year time period?
4. Is it s.s.?
5. Long run: parallels with infectious diseases, proximity analysis...

# TEAM 3: Heat Maps with 3-Month Lags

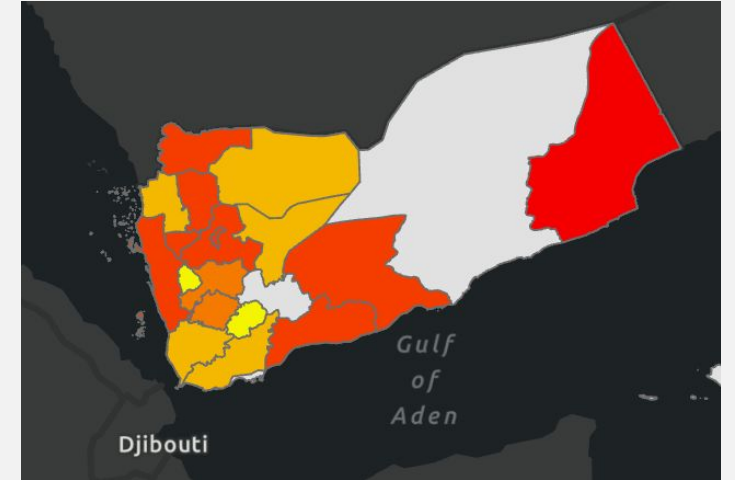

FCS July 2016

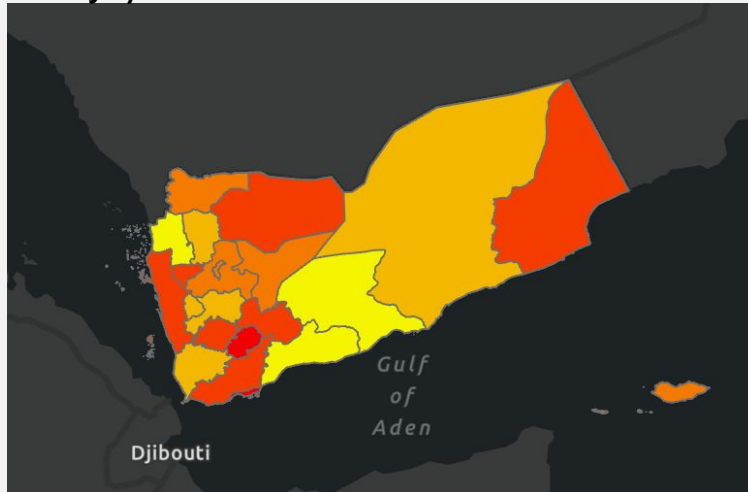

FCS October 2016

FCS December 2016

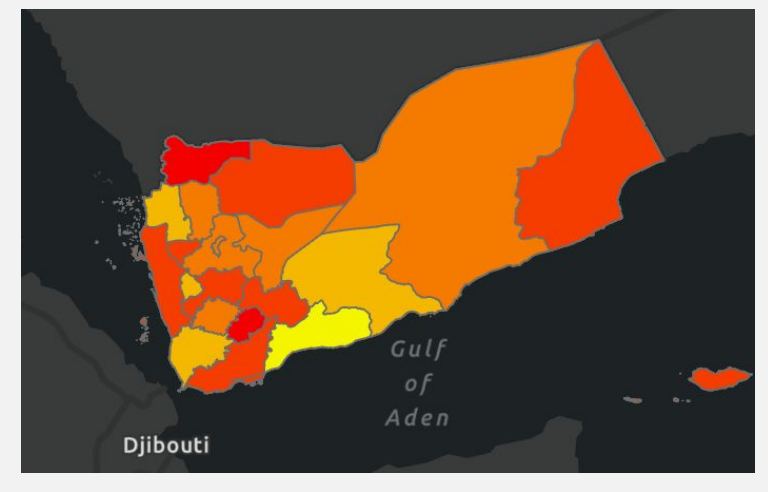

ToT July 2016

ToT October 2016

ToT December 2016
